Biology of Plagues: Evidence from Historical Populations Susan Scott, Christopher J. Duncan

The threat of unstoppable plagues, such as AIDS and Ebola, is always with us. In Europe, the most devastating plagues were those from the Black Death pandemic in the 1300s to the Great Plague of London in 1665. For the past 100 years it has been accepted that *Yersinia pestis*, the infective agent of bubonic plague, was responsible for these epidemics. This book combines modern concepts of epidemiology and molecular biology with computer-modeling. Applying these concepts to the analysis of historical epidemics, the authors show that they were not, in fact, outbreaks of bubonic plague. *Biology of Plagues* offers a completely new interdisciplinary interpretation of the plagues of Europe, and establishes them within a geographical, historical, and demographic framework. This fascinating detective work will be of interest to readers in the social and biological sciences, and lessons learned will underline the implications of historical plagues for modern-day epidemiology.
